

## Daniel Burrus

Leading Technology Futurist, AI Strategist, and Disruptive Innovation Expert.

**Anticipate. Accelerate. Lead.** The biggest leadership mistake today is waiting for disruption to happen before taking action.

AI, automation, digital transformation, workforce shifts, and new business models are advancing at extraordinary speed. Yet much of what leaders call “uncertainty” is actually predictable.

The question is: Can you see what’s coming before your competitors do?

In this high-impact keynote, Daniel Burrus reveals how leaders can use Hard Trends—future facts that will happen—to anticipate disruption, pre-solve predictable problems, and uncover opportunities before they become obvious.

Rather than reacting faster, Daniel shows audiences how to anticipate disruption and act earlier.

Using his proven Hard Trend Methodology, leaders learn to separate what will happen from what might happen, giving them greater certainty, lower risk, and the confidence to make bold moves.

Daniel also reveals how AI can dramatically accelerate innovation and performance—but only when leaders start with the right mindset. Organizations that rush to adopt AI tools without developing the critical thinking, judgment, questioning, creativity, and foresight needed to use them effectively will automate faster without necessarily creating more value.

The winning formula is simple:

Anticipatory Mindset. AI Skill Set. Strategic Tool Set.

When leaders combine future certainty with AI-enabled intelligence, they can see disruption sooner, innovate faster, make better decisions, and move on opportunity while competitors are still reacting.

**Lead With Certainty** Uncertainty gets all the attention. Certainty creates the biggest advantage.

Executives today are surrounded by volatility, disruption, economic pressure, AI acceleration, shifting customer expectations, and nonstop technological change.

The conventional response is agility. Move faster. Adapt faster. React faster. But even the fastest reaction happens after something changes.

Daniel Burrus offers leaders a more powerful alternative: anticipation.

In this provocative keynote, Daniel reveals how leaders can identify the parts of the future they can know with certainty—and use that knowledge to make better decisions today.

Through his proven Hard Trend Methodology, Daniel shows leaders how to distinguish between: Hard Trends—future facts that will happen. And Soft Trends—assumptions about the future that might happen and can be changed.

That distinction changes everything.

Once leaders know what they can be certain about, they can stop treating the entire future as unknowable.

They can anticipate disruption before it disrupts, turning disruption into a choice. Pre-solve

predictable problems to move forward faster. Identify game changing opportunities before competitors. Reduce risk. And make bold moves with greater confidence.

Instead of asking: What might happen?

Anticipatory Leaders ask: What do we know will happen—and what should we do about it now?

**Human-First AI** AI can make your organization faster. It can make it more efficient. It can also make it less trusted, less differentiated, and less human.

The question is not how much AI you can deploy. The question is where AI creates the most value—and where humans create the advantage.

In this provocative keynote, Daniel Burrus challenges the rush toward AI-First transformation and introduces a smarter strategy: Human-First AI.

Too many organizations begin by asking:

What can we automate? What can we eliminate? How many people can we replace?

Those questions may produce short-term efficiency, but they can also weaken employee engagement, critical thinking, customer relationships, institutional knowledge, service quality, and trust.

Daniel reframes the conversation.

The better question is:

How can AI help our people become more capable, more innovative, more productive, and more valuable?

Human-First AI begins with an Anticipatory Mindset—the ability to see change coming and recognize new opportunities. It continues with the human capabilities AI can simulate but not fully replace: judgment, creativity, strategic questioning, verification, communication, collaboration, and relationship-building.

Only then should leaders apply the AI tools that best support the outcome.

Daniel gives executives a practical way to decide what should be automated, augmented, transformed, elevated, or kept distinctly human.

The result is an organization that captures the extraordinary productivity of AI without sacrificing the trust, relationships, and human ingenuity that drive long-term growth.

**Futureview®** Every organization has a strategy. Far fewer have a shared view of the future that strategy is designed to serve. That is a dangerous gap.

How executives, employees, customers, and stakeholders view the future affects every decision they make today. When leaders and employees see different futures, priorities compete. Transformation slows. Innovation fragments. Employees hesitate. And opportunities are missed.

Your Futureview determines your future.

In this forward-looking keynote, Daniel Burrus introduces Futureview®, a powerful leadership framework for creating a shared view of what is coming—and aligning the organization around what to do about it.

At a time of accelerating AI, technological disruption, workforce transformation, and economic uncertainty, leaders cannot afford to chase every trend or react to every headline.

They need a way to determine: What matters? What is certain? What should we act on now? Using Daniel's proven Hard Trend Methodology, leaders develop an Anticipatory Lens that separates what will happen from what might happen. That clarity gives leadership teams a common way to evaluate strategy, innovation, investment, AI, workforce priorities, risk, and growth. More importantly, a compelling Futureview gives the organization something many employees desperately need during periods of rapid change: A believable reason to be confident about the future. When leaders share a clear Futureview, people make better decisions, move faster, innovate with greater purpose, and have the confidence to take action.

**Reinvent Work Before AI Does** The future of work is not five years away. It is being redesigned right now. Generative AI, agentic AI, automation, robotics, and digital coworkers are rapidly changing how work gets done, which skills matter, and where human beings create the greatest value. The danger is not simply that AI will eliminate jobs. The greater danger is that organizations will automate yesterday's work instead of reinventing tomorrow's work today. In this urgent and highly actionable keynote, Daniel Burrus shows leaders how to redesign work before disruption makes the decisions for them. Using his proven Hard Trend Methodology, Daniel reveals the technology-driven changes that are certain to reshape work over the next five to ten years—and what leaders should do now. Instead of asking: How do we use AI to do the same work faster? Daniel challenges leaders to ask: What should this work become now that humans and AI can do things together that neither could do alone? Leaders learn to examine every role, task, and workflow through a new lens: Eliminate it. Automate it. Augment it. Elevate it. Reinvent it. Or keep it human. Daniel also shows why the most future-ready organizations will develop both advanced AI capability and stronger human capability. As machines become more intelligent, distinctly human strengths—including judgment, creativity, trust, communication, strategic thinking, and relationship-building—become more valuable, not less.

**Know What's Next** The most successful leaders know how to manage today while preparing for and shaping what comes next. In this high-impact keynote, Daniel Burrus shows leaders how to apply his proven Hard Trend Methodology to identify the technology, demographic, and regulatory forces that will shape their industry, separate future facts from assumptions, and convert foresight into strategic action. Audiences learn how to rethink risk, pre-solve predictable problems, uncover emerging opportunities, and make better decisions early enough to reduce costs, accelerate innovation, and move before competitors.
